

Kama Properties

African vacation rentals — marketplace, payments, and host tools

<https://www.isisel.com>

Next.js 16

MongoDB Atlas

Flutterwave

Google OAuth

Resend Email

Vercel Production

Executive summary. Kama Properties is a production-ready short-stay rental platform with verified listings, real-time availability, dynamic pricing, secure checkout, automated booking confirmation emails, and separate experiences for guests, hosts, and admins — positioned to scale across West Africa and beyond.

1. Product vision & market potential

The platform addresses a growing demand for trusted, bookable vacation stays in markets where inventory is fragmented and payments cross borders. By combining discovery, messaging, calendar control, and card/mobile money checkout in one product, Kama Properties can capture both leisure travelers and diaspora visitors booking stays for family and events.

Guests

Browse listings, save favorites, book with transparent fees, receive branded confirmation emails, and manage trips from My Bookings.

Hosts

List properties, set nightly/weekly/monthly rates, block dates, apply custom day pricing, and get notified on every new reservation.

Platform

Admin moderation, transaction ledger, booking repair tools, and SEO-ready property pages on a verified domain.

Revenue levers

Service fee (7%) + cleaning fee (15% of stay base), multi-currency display (XOF, USD), and future subscription tiers for hosts.

2. Live capabilities (shipped)

Area	Capability	Business value
------	------------	----------------

Discovery	Property grid, filters, saved properties, rich listing pages with images & maps context	Conversion from browse to intent
Auth	Google sign-in, roles (guest / host / admin), host onboarding & verification flow	Low-friction trust & moderation
Availability	Per-property calendar API, host blocks, booking blocks, guest date-range picker	No double-bookings
Pricing	Nightly / weekly / monthly rates, custom per-day overrides on host calendar, fee breakdown at checkout	Revenue optimization per listing
Payments	Flutterwave checkout, transaction records, idempotent confirmed bookings linked to payments	Monetization with audit trail
Bookings	Guest My Bookings, host My Listings, admin create-booking repair for legacy transactions	Operational resilience
Email	Resend-powered guest & host templates with property photo, stay details, amounts (XOF), Kama logo	Professional post-purchase experience
Messaging	Guest–host threads tied to listings	Pre-booking qualification

3. Technical architecture

Layer	Stack
Frontend	Next.js 16 App Router, React 19, Tailwind CSS 4, responsive mobile chrome
Backend	Route handlers, Mongoose 9, MongoDB Atlas
Auth	NextAuth.js + Google OAuth, JWT sessions, trustHost for Vercel
Payments	Flutterwave (initialize + webhook + client verify)
Email	Resend SDK, HTML templates, optional dashboard templates (kama-booking-guest / host)
Hosting	Vercel production → www.isisel.com (project kemika02)

4. Booking & email flow (end-to-end)

1. Guest selects dates on listing → availability API validates stay nights.
2. Checkout shows stay total + 15% cleaning + 7% service fee in local currency.
3. Flutterwave payment succeeds → transaction saved → confirmed booking created (idempotent on transaction ID).
4. Branded emails sent to guest and host with property image, location, stay window, amount, and dashboard CTA.
5. Calendar blocks booked nights; host sees reservation in My Listings.

5. Growth & roadmap potential

- **Geographic expansion** — duplicate playbooks for Senegal, Ghana, Côte d'Ivoire with localized payment rails.
- **Host analytics** — occupancy, ADR, and revenue dashboards from existing booking + transaction data.
- **Reviews & trust** — post-stay ratings layered on verified bookings only.
- **Instant Book vs Request** — host-configurable booking modes on top of calendar API.
- **Mobile app** — API-first design supports React Native or Flutter client later.
- **B2B** — property managers with multi-listing calendars and team roles.

6. Traction indicators & readiness

Production

Deployed on Vercel with custom domain, MongoDB connected at build/runtime, payment + email env configured.

Multi-role

Guest, verified host, and admin paths implemented with middleware protection.

Real \$

Flutterwave live/test integration with transaction → booking linkage and admin repair path.

Comms

Transactional email on isisel.com domain (noreply@isisel.com) with property-coherent templates.

7. Repository & delivery

GitHub: [jymax4rl/oreilly_nextjs_project_BradTraversy](https://github.com/jymax4rl/oreilly_nextjs_project_BradTraversy)

Active line of work: feature/property-calendar-ui (bookings, rates, calendar UI, email templates)

Documentation: availability-calendar-design.pdf, this track record
