

Kama Properties

Project advancement report & next steps

Prepared: May 2026 · Branch: `feature/booking-modify-cancel`

<https://www.isisel.com>

- Production live
- Cloudinary media
- Direct browser uploads
- Bookings & payments
- Host onboarding

Summary. Kama Properties is a live African vacation-rentals marketplace on **www.isisel.com**, built with Next.js 16, MongoDB Atlas, and Vercel. Recent work focused on **Cloudinary** for property images (migration complete for seed data, direct uploads for new listings), a reliable **add-listing wizard**, and **guest booking modify/cancel** with lifecycle emails. The platform is usable end-to-end for verified hosts and guests; remaining work is mainly merge/integration, SEO, and operational polish.

1. Production & infrastructure

Item	Detail
Live site	https://www.isisel.com
Vercel project	<code>kemika02</code> (app root: <code>property_app/</code>)
Repository	<code>github.com/jymax4rl/oreilly_nextjs_project_BradTraversy</code>
Database	MongoDB Atlas — <code>KamaProperties</code>
Auth	NextAuth — Google OAuth
Payments	Flutterwave (+ GeniusPay integration path)
Email	Resend — booking lifecycle templates
Media CDN	Cloudinary — <code>res.cloudinary.com</code>

2. Completed capabilities (current advancement)

2.1 Cloudinary media (major milestone)

Status: operational in production. Cloudinary is configured and used for property images and audio. Legacy local files under `public/properties/` were backfilled; MongoDB stores

secure_url and publicId per asset.

- **Folder layout:** kama-properties/hosts/{hostId}/properties/{propertyId}/images (and /audio)
- **Backfill:** `npm run db:backfill-cloudinary-folders` — 37/37 seed listings migrated
- **Provision:** `npm run db:provision-cloudinary-folders`
- **Audit:** `npm run db:audit-property-images`
- **New listings:** browser uploads *directly* to Cloudinary (signed upload); Vercel only saves JSON metadata — avoids 4.5MB body limits and supports multiple photos
- **Display:** galleries, cards, emails, and booking flows resolve URLs from MongoDB

2.2 Host listing creation

- Multi-step add-property form with per-field validation and step blocking
- Mobile-friendly photo picker (camera + gallery); optional client-side resize fallback
- Guest contact: default from **host profile** (username, account email, onboarding phone); optional per-listing email/phone override
- Carousel layout fix for last wizard step; media PATCH API fix for Next.js 16 async `params`

2.3 Bookings, calendar & payments

- Property availability API and host calendar UI
- Guest bookings with rates (nightly / weekly / monthly)
- Guest **modify / cancel** bookings with versioned updates and lifecycle emails
- Flutterwave payment initialize + webhook; transaction → booking flow
- Admin: host approval, transactions, manual booking creation

2.4 Host & guest experience

- Host onboarding application and verified-host gate for listings
- Messaging between guest and host on property threads
- Saved properties, my bookings, host listings dashboard
- Multi-currency display context; branded confirmation emails

3. Architecture: how new listing photos work

Step	What happens
1	Host submits listing JSON → <code>POST /api/properties</code> creates property + signed Cloudinary upload params
2	Browser uploads each file to <code>api.cloudinary.com</code> (not through Vercel)
3	<code>PATCH /api/properties/{id}/media</code> saves image URLs and folder metadata in MongoDB
4	Redirect to live property page on <code>www.isisel.com</code>

Why this matters: the earlier “migration” moved **storage** to Cloudinary; this flow removes Vercel as a file proxy so multiple full-size phone photos work reliably.

4. Development state (May 2026)

Active branch

`feature/booking-modify-cancel` — deployed to production via Vercel CLI; includes Cloudinary, form fixes, and contact choice.

Integration branch

`master` — default on GitHub; feature branch ahead with recent commits. Recommend PR + merge when ready.

Recent production deployments (commits): Cloudinary media + form carousel (`6df734f`), direct uploads + validation (`0932426`), media API params fix (`b87b055`), optional host contact (`ab8ebd8`).

5. Recommended next steps

Priority	Area	Action
Done	Cloudinary	Env on Vercel (<code>CLOUDINARY_URL</code>); backfill; direct uploads — keep monitoring new host listings
High	Git / release	Open PR from <code>feature/booking-modify-cancel</code> → <code>master</code> ; merge after smoke test on isisel.com
High	Security	Review draft PR #3 (Next.js RSC CVE patch); apply if still relevant
Medium	SEO	Complete <code>seo/generate-metadata-jsonld</code> branch — sitemap, robots, JSON-LD for listings
Medium	Payments	Production Flutterwave / GeniusPay keys; webhook URL verification on Vercel
Medium	Admin	Host approval workflow QA; transaction reconciliation
Low	UX	Photo grid on add-listing for 10+ thumbnails (scroll / pagination) — cosmetic only
Low	Docs	Runbook: reprovision folders for new hosts; periodic <code>db:audit-property-images</code>

6. Environment checklist (production)

- `NEXT_PUBLIC_SITE_URL` , `NEXT_PUBLIC_DOMAIN` , `NEXTAUTH_URL` → `https://www.isisel.com`
- `MONGODB_URI` , `NEXTAUTH_SECRET` , Google OAuth (callback includes production domain)
- `CLOUDINARY_URL` (or `CLOUDINARY_CLOUD_NAME` + API key/secret)
- Flutterwave / Resend keys as used in payment and email flows

7. Conclusion

Kama Properties has moved from a course-style property app to a **production marketplace** with verified hosts, payments, messaging, and a solid **Cloudinary-backed media layer**. The add-listing flow now matches how modern marketplaces handle photos (direct CDN upload, metadata in MongoDB). The main forward path is **consolidating branches on master**, hardening payments and SEO, and continuing operational monitoring of Cloudinary and booking emails on `www.isisel.com`.
